DETAILED ACTION

Election/Restrictions

The Examiner has withdrawn the Species Restriction Requirement mailed
 11/14/06 based on Applicant's traversal that the species are all sufficiently related.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 2. Claim 13 is rejected under 35 U.S.C. 102(b) as being anticipated by Gahlau (4,705,139). Gahlau teaches a sound-absorbing unit (Figure 2) comprising: a partition plate having a plurality of recesses (1) formed in a first side (side near #5) thereof, each of said recesses (1) having an opening with a predetermined shape on the first side; and a sound-absorbing material (4) (Col. 5, Lines 18-21) provided on the first side (side near #5) of the partition plate to cover the openings of the recesses (1), wherein each of the recesses has a cross-sectional area that gradually varies with a depth of the recess (1) (clearly show in Figure 2).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the

Art Unit: 2837

invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

- 3. Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gahlau (4,705,139). Gahlau is relied upon for the reasons and disclosures set forth above. Gahlau fails to teach wherein the thickness of air spaces behind the sound-absorbing material is set to odd multiples of one-fourth of the wavelength of sound waves of target frequencies. However, It would have been obvious to one of ordinary skill in the art at the time the invention was made to provide the thickness of air spaces behind the sound-absorbing material set to odd multiples of one-fourth of the wavelength of sound waves of target frequencies, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or working range involves only routine skill in the art. In re Aller, 105 USPQ 233. Further, such a modification would have involved a mere change in the size of a component. A change in size is generally recognized as being within the level of ordinary skill in the art. In re Rose, 105 USPQ 237 (CCPA 1955).
- 4. Claims 1 and 2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zaima (5,134,014) in view of Roller (6,186,2701). Zaima teaches a sound-absorbing structure (Figure 5, #10), comprising: a substantially flat base (11); a substantially flat sound-absorbing material (14) arranged substantially parallel to the base (11); and a corrugated partition plate (12) interposed between the base (11) and the sound-absorbing material (14), the corrugated partition plate (12) having upper antinode portions opposed to the sound-absorbing material (14) and lower antinode portions opposed to the base (11); wherein the lower antinode portions of the corrugated partition plate (12) are at least partially separated from the base (11); wherein parts of

the lower antinode portions of the corrugated partition plate are supported via an elastic element (18 – foam #18 can be a flexible foam having elastic characteristics) (Col. 5, Lines 64-67) by low-vibration portions of the support base. Zaima fails to teach wherein the base element is a support base. Roller teaches a substantially flat support base (Figure 2, #1). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Zaima, with the apparatus of Roller to provide better structural support for the headliner.

Claims 3-7 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable 5. over Zaima (5,134,014) in view of Nishimura (JP 11-161282). Zaima teaches a soundabsorbing unit (Figure 5, #10) comprising: a corrugated partition plate (12) having a first side and a second side opposite to the first side; a substantially flat sound-absorbing material (14) provided on the first side of the corrugated partition plate (12); a second sound-absorbing material (18) provided on the second side of the corrugated partition plate (12); and wherein the corrugated partition plate (12) includes a sine wave pattern. Zaima fails to teach at least one second partition plate configured to partition air spaces defined between the sound-absorbing material and the corrugated partition plate; wherein the second partition plate extends in a direction substantially perpendicular to a direction in which antinode portions of the corrugated partition plate extend; wherein the second partition plate is provided only on the first side of the corrugated partition plate; wherein the corrugated partition plate includes a wave pattern whose phase is shifted at an intersection of the corrugated partition plate and the second partition plate; wherein the corrugated partition plate includes a wave pattern whose amplitude is varied at an intersection of the corrugated partition plate and the second partition plate. Nishimura teaches at least one second partition plate (Figure 5, #54) configured to partition air

Art Unit: 2837

spaces (acknowledged by Applicant on Page 1, Paragraph 2 of the Specification) defined between the sound-absorbing material and the corrugated partition plate when used in combination with Zaima; wherein the second partition plate (54) extends in a direction substantially perpendicular to a direction in which antinode portions of the corrugated partition plate extend when used in combination with Zaima; wherein the second partition plate (54) is provided only on the first side of the corrugated partition plate (#42, when used in combination with Zaima); and wherein the corrugated partition plate includes a wave pattern whose phase is shifted at an intersection of the corrugated partition plate and the second partition plate (54) when used in combination. It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Zaima, with the apparatus of Nishimura to improve the sound-absorbing coefficient by dividing the air layer.

6. Claims 8 and 10-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zaima (5,134,014) in view of Nishimura (JP 11-161282), as applied to claim 3, and further in view of Roller (6,186,2701). Zaima and Nishimura are relied upon for the reasons and disclosures set forth above. Zaima further teaches a corrugated partition plate (Figure 5, #12). Nishimura further teaches second partition plate (Figure 5, #54). Zaima and Nishimura fail to teach wherein the corrugated partition plate includes a rectangular wave pattern; wherein the corrugated partition plate includes wave patterns with different frequencies; wherein the corrugated partition plate includes wave patterns with different amplitudes; and wherein the corrugated partition plate includes a wave pattern whose amplitude is varied at an intersection of the corrugated partition plate and the second partition plate. Roller teaches corrugated partition plate including a rectangular wave pattern (Figure 7, #2); wherein the corrugated partition (2) plate

Art Unit: 2837

includes wave patterns with different frequencies (See varied lengths of plates defining frequencies); wherein the corrugated partition (2) plate includes wave patterns with different amplitudes (See varied heights of plates defining amplitude); and wherein the corrugated partition plate includes a wave pattern whose amplitude is varied at an intersection of the corrugated partition plate (2) and the second partition plate, when combined with Zaima as modified. It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Zaima as modified, with the apparatus of Roller to absorb a wide range of frequencies and amplitudes. Further, it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or working range involves only routine skill in the art. In re-Aller, 105 USPQ 233. It has been held that discovering the optimum value of a result effective variable involves only routine skill in the Art. In re Boesch, 617 F.2d 272, 205 USPQ 215 (CCPA 1980). A change in size is generally recognized as being within the level of ordinary skill in the art. In re Rose, 105 USPQ 237 (CCPA 1955). It has been held that a recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus satisfying the claimed structural limitations. Ex Parte Masham, 2 USPQ F.2d 1647 (1987).

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Pertinent arts of record relating to sound absorbing structures and units are disclosed in the PTO-892.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jeremy Luks whose telephone number is (571) 272-
